ABSTRACT OF THE DISCLOSURE

05747510-12200  
00327-079460

A light-absorptive antireflection film comprising a  
light-absorptive film formed on a glass substrate  
containing pigment microparticles and having a physical  
10 thickness of not less than 10 nm and an antireflection  
multilayer film attenuating reflected light of incident  
light by interference of light, wherein at least one  
layer of the antireflection multilayer film is an  
electroconductive thin film having a surface resistance  
15 of not more than  $1000 \Omega/\square$ , and a display device  
including the same and methods of producing them.
